

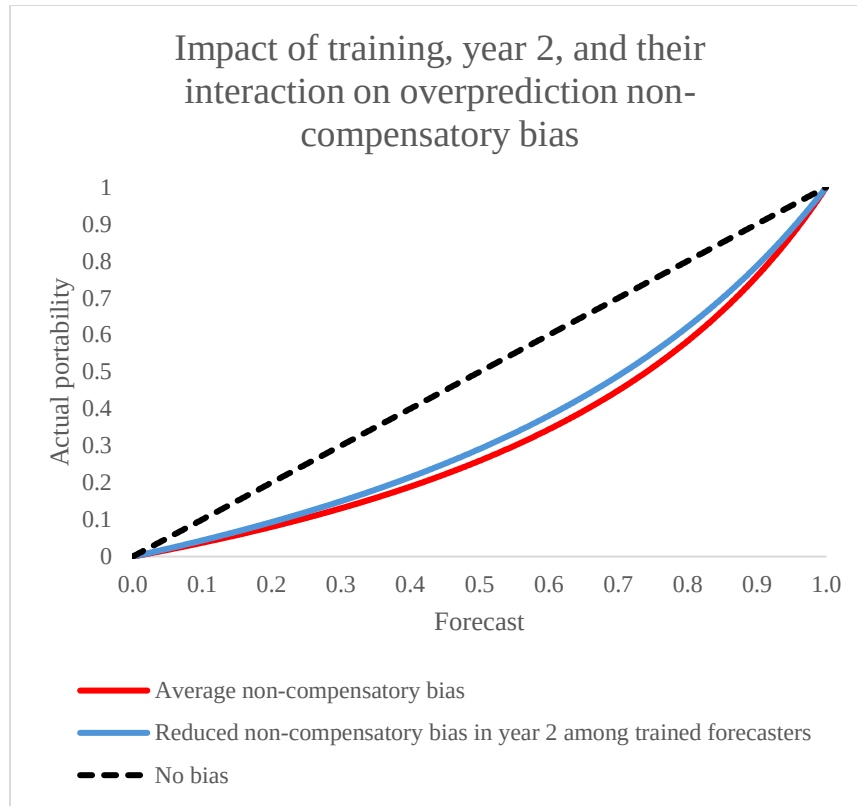

Figure 4. Training, Year 2, and their interaction impact on non-compensatory bias.

The dotted 45-degree line shows no calibration biases. The red line displays the overprediction bias across the entire sample ($b_0:\text{Model5}=-1.05$). The blue line illustrates how overprediction is lower for trained forecasters in year 2. Its slope is -0.89 ($b_0:\text{Model5}=-1.05+b_2:\text{Model5}=-0.05+b_3:\text{Model5}=0.07+b_4:\text{Model5}=0.14$).
